

玫瑰扦插繁殖之條件

陳彥睿

台中區農業改良場

摘要

玫瑰的繁殖方式有高壓、扦插、嫁接、組織培養等方式，目前國內採用扦插法為主，在荷蘭Aalsmeer試驗場已建立適合玫瑰扦插繁殖最適條件，供應生產岩棉栽培用玫瑰，國內亦有必要建立一套自己的扦插繁殖條件。玫瑰花一般的扦插方式是以3~5節進行扦插，但成活率不高，近年已有採用單節扦插方式，利用良好之設備條件，成活率有提高之現象。扦插苗較之傳統採用高壓繁殖可較省工及繁殖倍數較高，比較扦插苗之發育與其他方式培育之種苗，共並無明顯差異。

玫瑰不定根的形成可分為根原體引發分化期、根原體分化期、新根出現3階段，玫瑰不定根形成的位置在於次級韌皮部發生，其發生的過程係先產生癒傷組織再生根。

植物扦插繁殖成功與否的條件受內在及外在因子影響，其中(一)內在因素包括：(1)化學因素如：生長素、營養物質的含量。(2)生物因子：插穗的長度、位置、成墾度等。(二)外在因素：光度、溫度、濕度、長短日照、插穗用介質、及外加生長素、外加糖份營養劑等影響。

玫瑰扦插繁殖之條件

玫瑰之文獻資料集 NO.4 (植與種苗)

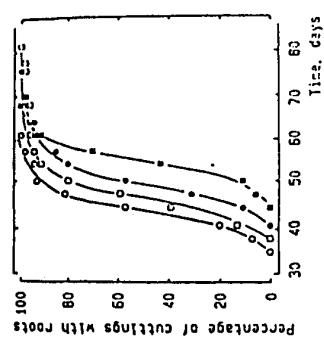

Fig. 1. Percentage of cuttings with roots as a function of time. Cuttings were treated with 20°C for 2 (\circ - \circ), 3 (\square - \square) or 4 (\bullet - \bullet) weeks followed in each case by 23°C or with 20°C for 9 weeks (\square - \square)

Root formation and axillary bud break after different temperatures and durations of these temperatures during the rooting period. After treatments with 17 or 20°C for 2, 3 or 4 weeks the cuttings were exposed to 23°C until rooting was assessed 9 weeks after excision and planting of the cutting

Duration of temperature treatment	Temperature (°C)		
	17	20	23
Mean number of roots per cutting			
2	5.6bcd	7.1 ^e	
3	5.2bc	6.7ae	
4	5.1b	6.9 ^c	
9	0a	6.3ae	8.3 ^f
Percentage of cutting with roots			
2	98.1 ^{ab}	100 ^a	
3	96.3 ^{ab}	98.1 ^{ab}	
4	92.6 ^b	98.1 ^{ab}	
9	1.9 ^c	96.3 ^{ab}	98.2 ^{ab}
Mean number of days until root appearance			
2	49.9 ^{cd}	44.9 ^e	
3	57.4 ^b	48.0 ^d	
4	57.4 ^b	51.8 ^c	
9	91.2 ^a	56.3 ^b	41.8 ^f
Mean number of days until bud break			
2	98.0 ^{cd}	90.8 ^{ef}	
3	102.4 ^{bc}	95.3 ^{de}	
4	106.1 ^b	95.8 ^{de}	
9	121.0 ^a	103.4 ^{bc}	86.9 ^f

Values followed by different superscripts are significantly different using LSD values ($P<0.05$)

Table 1 The effect of position of rose cuttings on bud break and root formation. The positions are numbered from top downwards.

Cultivar	Position	Bud break %	Root-formation %	Roots per cutting	Length of root cm
Carnette	3	100	100	7.4	8.1
	4	100	100	8.1	6.4
	5	83	100	7.4	6.6
Tizee, d'Ys	6	63	100	7.2	6.5
